

## Team Members

- Jory Anderson (V00843894)
- Note: My original team of 3 disbanded due to the challenges presented by CoViD-19. I have decided to complete the project regardless.

## Requirements

- JDK 11 (Cannot guarantee successful compilation on other versions)
- minisat (Available on UVic Linux machines)

## Documentation / Building

1. After extracting the contents of the tarball, compile all java files in the archive by performing the following in command line / terminal

```
javac *.java
```

- Ensure your working directory in terminal/cmd is set to the 'subid' folder of the submission (i.e., 'jba')

2. Once completed, take a properly formatted puzzle.txt file (see project.pdf), and perform the following command:

```
java sud2sat < puzzles/puzzle.txt > puzzle.cnf
```

- Note: sud2satextended can be used in a manner identical to sud2sat. Simply substitute the command.

This will use "puzzle.txt" as the input (i.e., the file containing the incomplete sudoku puzzle), and create a new file called "puzzle.cnf" as the output. This file contains the DIMACS-formatted file used with

```
minisat
```

3. Using the newly created "puzzle.cnf" file, perform the following:

```
minisat puzzle.cnf assign.txt > stat.txt
```

After executing the above, you will receive two files, "assign.txt" and "stat.txt"

- "assign.txt": A file generated by minisat. Contains one or two lines determining satisfiability.
- "stat.txt": The output of minisat. Will contain statistics pertaining to solving.

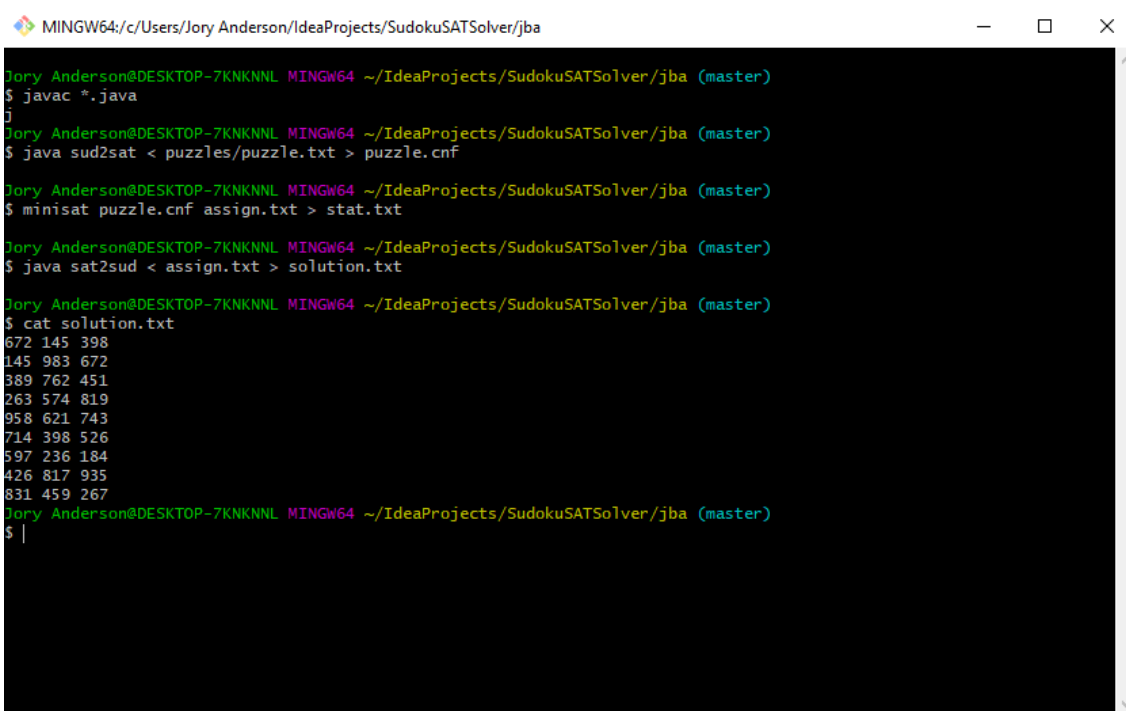

4. To solve, run the provided "sat2sud" command like so:

```
java sat2sud < assign.txt > solution.txt
```

sat2sud takes the file generated by minisat, formats the completed sudoku problem, and outputs it into solution.txt

## Example Build / Execution (Simple)

```
javac *.java
java sud2sat < puzzles/puzzle.txt > puzzle.cnf
minisat puzzle.cnf assign.txt > stat.txt
java sat2sud < assign.txt > solution.txt
```

A screenshot of a terminal window titled "MINGW64:/c:/Users/Jory Anderson/IdeaProjects/SudokuSATSolver/jba". The terminal shows the following commands and output:

```
Jory Anderson@DESKTOP-7KNKNNL MINGW64 ~/IdeaProjects/SudokuSATSolver/jba (master)
$ javac *.java
Jory Anderson@DESKTOP-7KNKNNL MINGW64 ~/IdeaProjects/SudokuSATSolver/jba (master)
$ java sud2sat < puzzles/puzzle.txt > puzzle.cnf
Jory Anderson@DESKTOP-7KNKNNL MINGW64 ~/IdeaProjects/SudokuSATSolver/jba (master)
$ minisat puzzle.cnf assign.txt > stat.txt
Jory Anderson@DESKTOP-7KNKNNL MINGW64 ~/IdeaProjects/SudokuSATSolver/jba (master)
$ java sat2sud < assign.txt > solution.txt
Jory Anderson@DESKTOP-7KNKNNL MINGW64 ~/IdeaProjects/SudokuSATSolver/jba (master)
$ cat solution.txt
672 145 398
145 983 672
